

The idea of Dev/Ops

Modern DevOps for Systems Biologists

Jun Allard

Why now

The problem

- ▶ TODO: the failure this unit is about, stated as something that has happened to the audience
- ▶ TODO: why it is worse in computational biology than elsewhere

What Dev/Ops actually means

TODO: the loop, end to end.

- ▶ TODO
- ▶ TODO

Small batches

End-to-end first, then deep

TODO: the argument for a thin working pipeline before any one stage is good.

What that looks like in a project

TODO

The unreliable team-mate

Valuable, and not to be trusted

TODO: supervising a generative model the way you would supervise a capable, fast, overconfident rotation student.

A worked example

```
# Shell on a slide is shown, never run --- the same rule the activities for  
git log --oneline -5
```

Next

Where this goes

- ▶ TODO: what Activity 1 asks them to do
- ▶ TODO: what the next unit picks up
