

Guide to “A typical (fictional) paper”

Modern DevOps for Systems Biologists

Jun Allard

A companion to [allardjun/a-typical-paper](#), the worked example this course keeps coming back to.

Open the repository beside this page. The point of the example is not the science in it — there is none — but the shape: what a computational paper’s repository looks like when the work has been done well, and where each unit of this course shows up in it.

What you are looking at

TODO: one paragraph on what the fictional paper claims, so the repository has a purpose to be judged against.

The tour

TODO: walk the top level, directory by directory, and say what each one is for.

Where	What lives there	Unit
TODO	TODO	1
TODO	TODO	2
TODO	TODO	4

What Unit 1 would notice

TODO: the commit history, the `.gitignore`, where the large data went and why it is not in the repository.

What Unit 2 would notice

TODO: branches, the pull requests, what CI is checking and what it is not.

What Unit 4 would notice

TODO: the environment specification, the lockfile, the container, and which of the four kinds of documentation are present.

What is deliberately wrong with it

TODO: the two or three things left broken on purpose, and what breaks downstream because of them.

TODO: this is the part to write last — it is the one students will actually argue about.
