

Multi-repo version control

Modern DevOps for Systems Biologists

Jun Allard

Working with a team

One repository, several histories

TODO: fork and clone, and which one you actually want.

```
git clone https://github.com/OWNER/REPO.git  
git remote -v
```

Branching

A branch is a name for a commit

TODO: why this is cheap, and why that changes how you work.

```
git switch -c fix/normalisation  
git switch main  
git merge fix/normalisation
```

Merge conflicts

TODO: what a conflict is, and why it is not a failure.

- ▶ TODO
- ▶ TODO

```
git blame
```

TODO: not for blame.

```
git blame -L 40,60 analysis.py
```

Pull requests

Review as the unit of work

- ▶ TODO: what a good pull request is small enough to be
- ▶ TODO: what a reviewer is actually for

CI/CD

The green check

TODO: a runner, a workflow, and what it costs to have one.

```
cat .github/workflows/ci.yml
```

Next

Activity 2

- ▶ TODO: what they will do in the cloud repository
- ▶ TODO: the conflict they will be asked to resolve
