

Single repo version control

Modern DevOps for Systems Biologists

Jun Allard

Working with your past and future self

Plain text is the substrate

- ▶ TODO: why the format you can diff is the format you can keep
- ▶ TODO: Markdown as the least you can get away with

git

A commit is a snapshot, not a diff

TODO: the object model, and why the hash is the name.

```
git add analysis.py
git commit -m "Fit the decay rate before normalising"
git log --oneline
```

Four reasons to commit

TODO: the checkpoint, the message, the bisect, the blame.

▶ TODO

▶ TODO

.gitignore

TODO: what never belongs in a repository, and why the answer is not “big things”.

```
cat .gitignore  
git status --ignored
```

Finding the commit that broke it

```
git bisect start  
git bisect bad  
git bisect good v1.0
```

TODO: the point is that this is a search, and searches want a test.

Where things live

Directory architecture, and large data

TODO: the three places, and which one the data goes in.
